SOP-AE-INTAKE-HANDLING-004: Suspected Adverse Event Intake Handling

Version 1.0 | Effective 2026-03-01 | Classification: Synthetic / Non-Clinical

1. Purpose

This fictional SOP explains how operators capture Suspected Adverse Event (AE) reports in the local Intake Tracker.

The application must never assess causality, recommend treatment, or decide regulatory reportability.

2. Required AE Fields

In addition to core fields (product, LOT-XXXXX, date received, reporter type, description), AE reports require:

Event description — what was reported, without real patient identifiers.

Event onset date — fictional date when the reported event began.

3. Worked Example

REF-2026-0002 | CardioSafe 10mg | LOT-12045 | Reporter type: Healthcare Professional.

Event description: Dizziness / lightheadedness. Event onset date: 2026-10-13.

Status starts as New, then may move to In Review under triage workflow.

4. Prohibited Content

Do not enter real patient names, phone numbers, addresses, or medical record numbers.

Do not write treatment plans or causality conclusions in the description fields.
